

Namespace Extism.Sdk

Classes

[ByteArrayWasmSource](#)

Wasm Source represented by raw bytes.

[CurrentPlugin](#)

Represents the current plugin. Can only be used within [HostFunctions](#).

[ExtismException](#)

Represents errors that occur during calling Extism functions.

[HostFunction](#)

A function provided by the host that plugins can call.

[Manifest](#)

The manifest is a description of your plugin and some of the runtime constraints to apply to it. You can think of it as a blueprint to build your plugin.

[MemoryOptions](#)

Configures memory for the Wasm runtime. Memory is described in units of pages (64KB) and represent contiguous chunks of addressable memory.

[PathWasmSource](#)

Wasm Source represented by a file referenced by a path.

[Plugin](#)

Represents a WASM Extism plugin.

[UrlWasmSource](#)

Wasm Source represented by a file referenced by a path.

[WasmSource](#)

A named Wasm source.

Enums

[HttpMethod](#)

HTTP defines a set of request methods to indicate the desired action to be performed for a given resource.

[LogLevel](#)

Extism Log Levels

Delegates

[ExtismFunction](#)

A host function signature.
